

# Finite Groups of Derangements on the $n$ -Cube

Larry Cusick

October 11, 2007

## **Abstract**

The group of symmetries of the  $n$ -cube is understood to be the group of signed permutations, the so-called hyperoctahedral group. The question we explore is this: for a given  $n$ , what finite groups act as derangements of the set of  $k$ -faces?
